

A Local Platform For Buying, Selling And Identifying Herbs Online

ABSTRACT

This project aims to develop a web application that serves as a local marketplace for buying and selling herbs. The platform connects herb cultivators, local sellers, and consumers within a specific geographic area, promoting the use of natural remedies and supporting local businesses. A unique feature of the platform is an AI-powered herb identification tool that allows users to upload a photo of a herb and get its name, details, and potential uses using image recognition technology.
